4.a) - Data Modelling and Form Design

Aim

To design and develop an Insurance Claim Request & Processing Management System using Zoho Creator by creating structured forms, applying appropriate validations, generating reports, and managing insurance claims, investigations, approvals, rejections, and settlements.

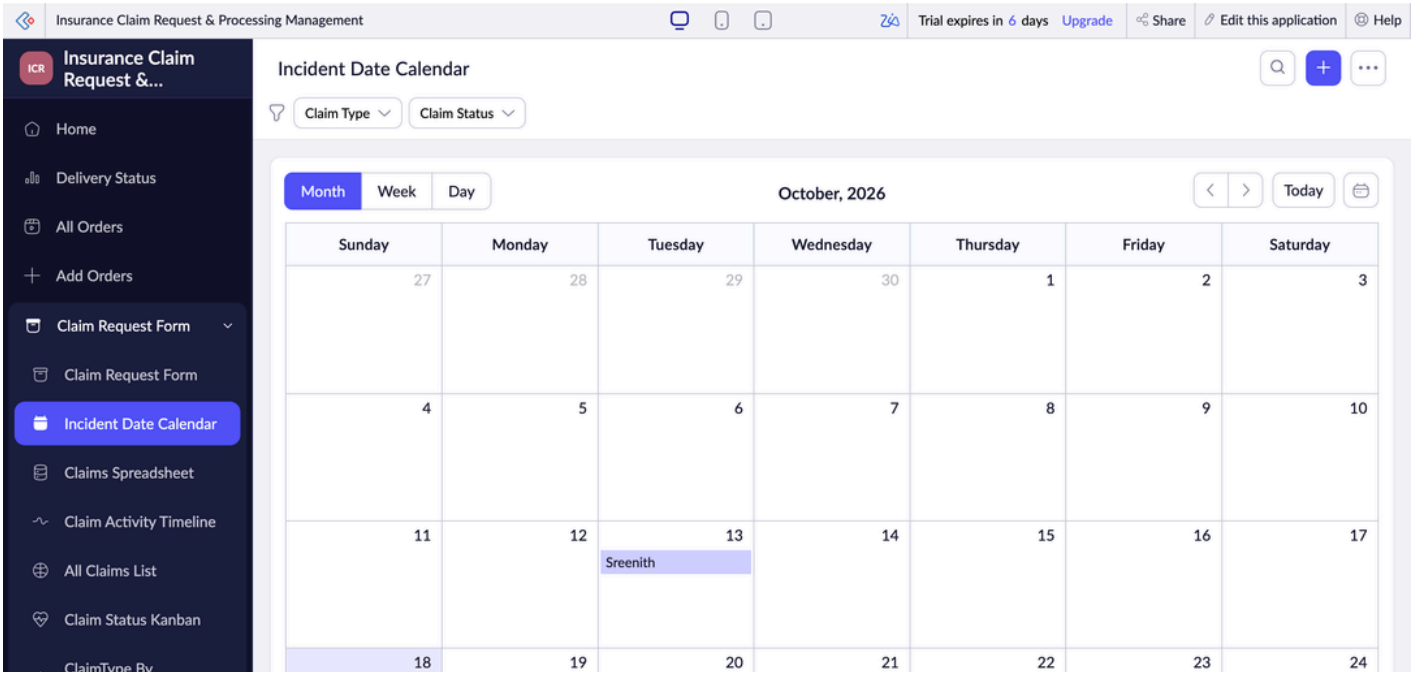

Theory

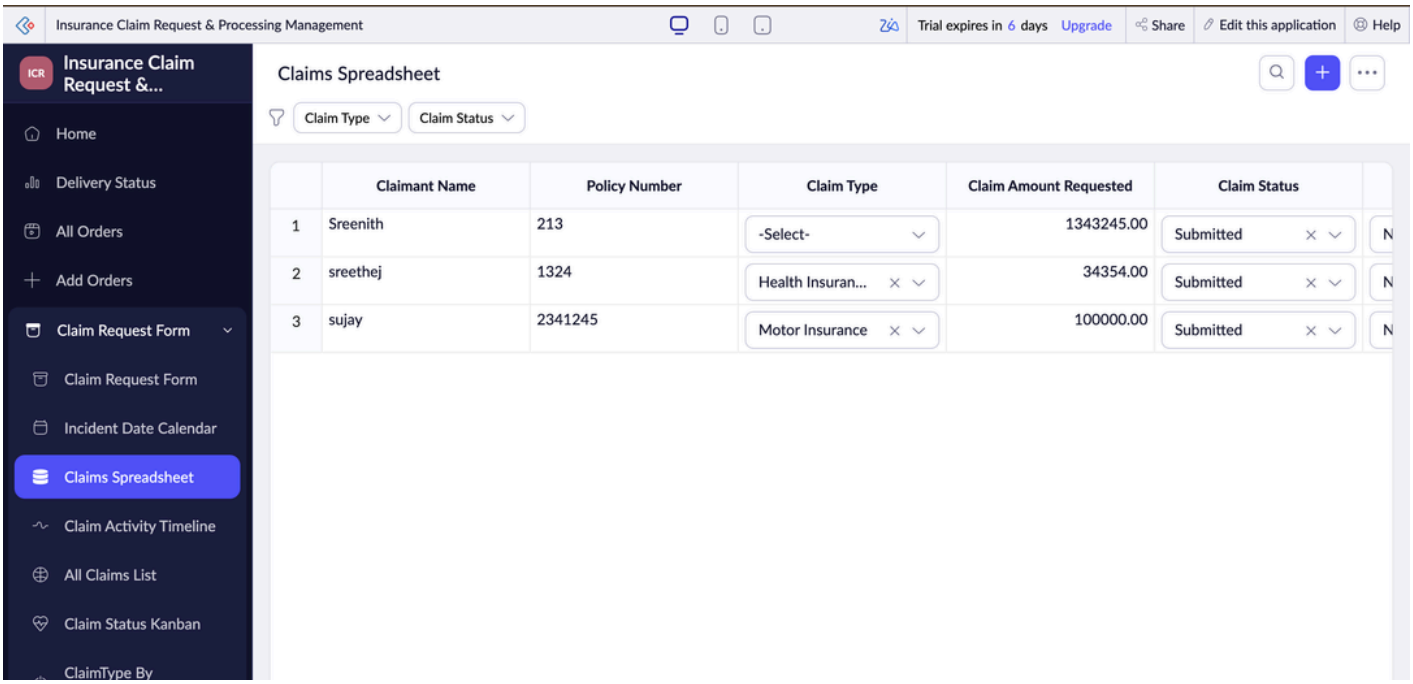

1. Data modelling and form design involve organizing data into suitable fields and forms for efficient data collection, storage, and management. Zoho Creator provides field types such as Single Line, Multi Line, Number, Date, Phone, Email, Dropdown, and Lookup.
2. In this experiment, an Insurance Claim Request & Processing Management application is developed to manage insurance claims through a claim request form, reports, workflows, and a dashboard.
3. The Claim Request Form collects claimant details, policy number, contact information, claim type, requested claim amount, policy dates, incident date, incident location, and incident description.
4. The system manages claim processing through different statuses, including Submitted, Under Investigation, Approved, Rejected, and Settled. It also records surveyor assignments, investigation notes, approved amounts, settlement dates, and rejection reasons.
5. Validations are applied to improve data accuracy. These include mandatory fields, valid field types, non-negative claim amounts, valid policy date ranges, and checks to ensure that the incident date falls within the policy period.
6. Reports are created to organize and analyze claim records. These include List, Spreadsheet, Kanban, Calendar, Map, Timeline, Pivot Table, Chart, and Summary reports. Workflows automate claim submission, investigation, approval, rejection, and settlement processes.
7. The application demonstrates how a low-code platform can provide centralized claim management, improve data accuracy, automate processing, and support insurance decision-making.

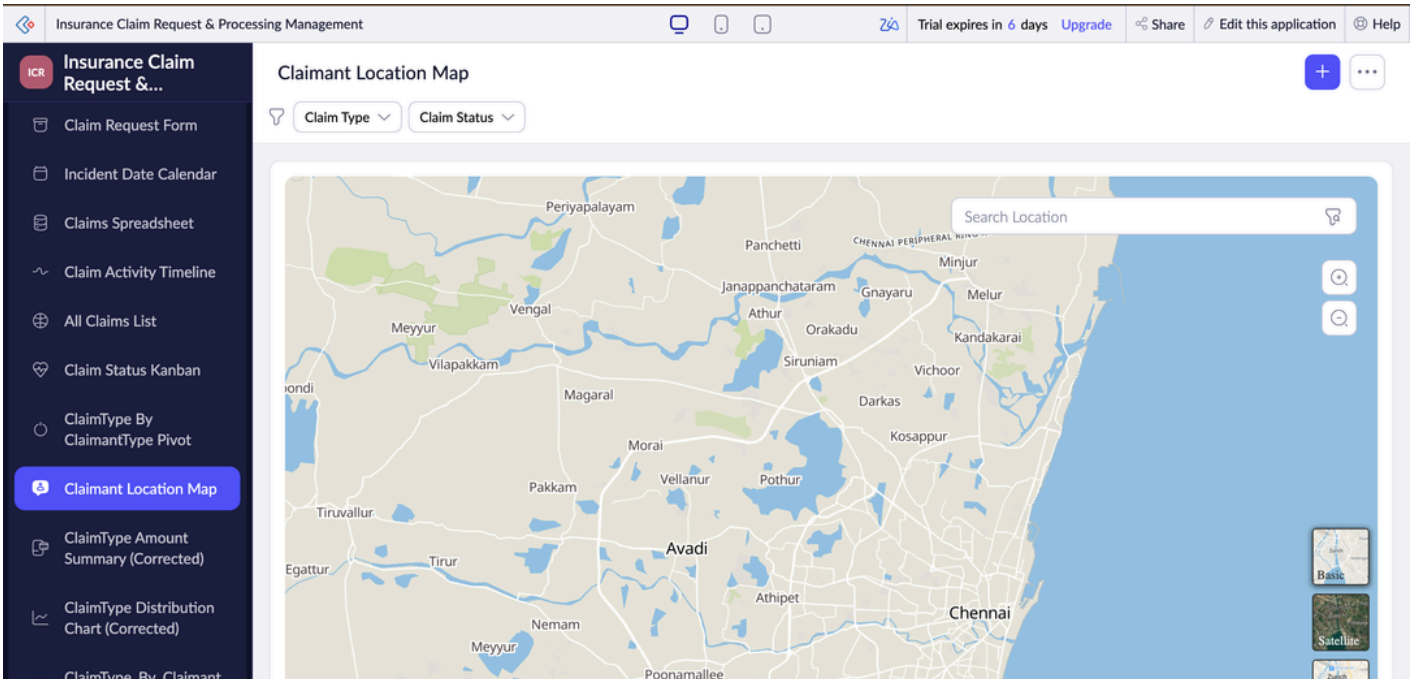

Procedure

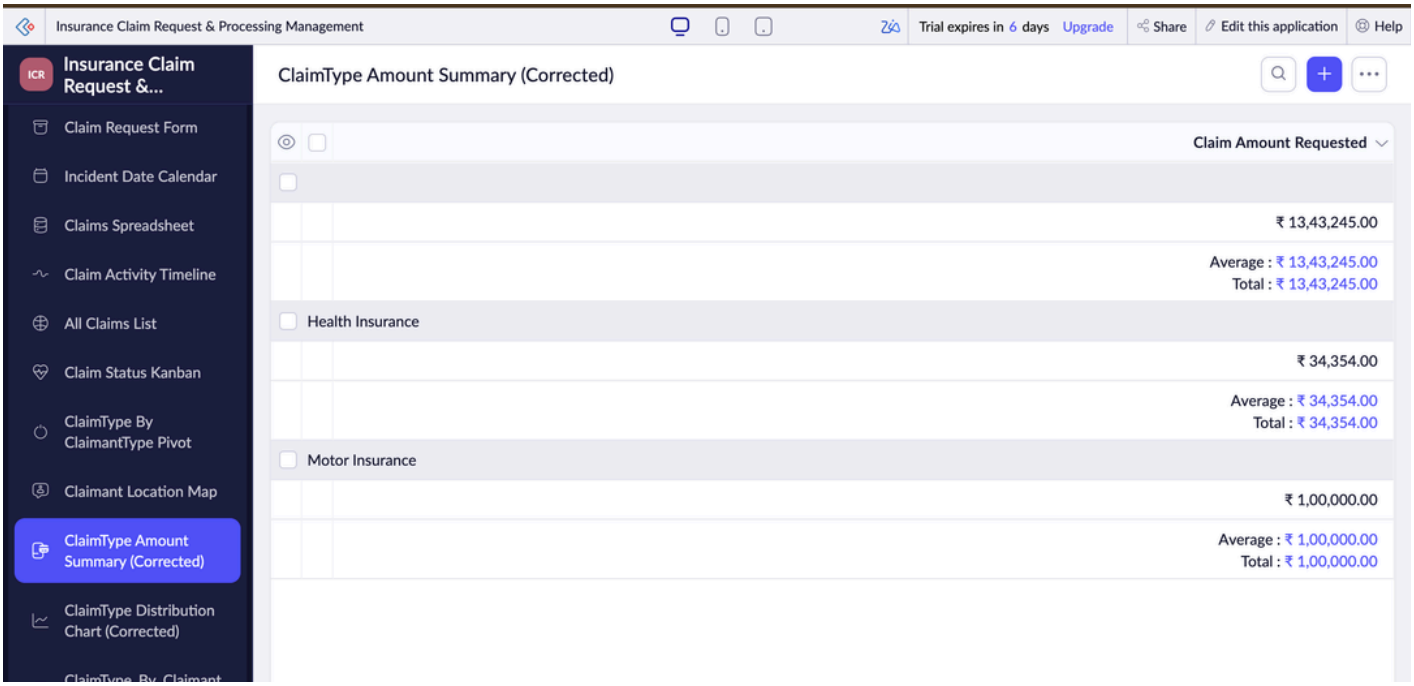

1. Open Zoho Creator and create the Insurance Claim Request & Processing Management application.
2. Create the Claim Request Form and add the required claimant, policy, incident, and claim details.
3. Configure appropriate field types, mandatory fields, and dropdown options.
4. Apply validation rules for claim amounts, policy dates, and incident dates.

5. Create the List, Spreadsheet, Kanban, Calendar, Map, and Timeline reports.
6. Configure the Pivot Table to analyze claim counts by Claim Type and Claimant Type.
7. Create the Pie Chart to display the distribution of claims by Claim Type.
8. Configure the Summary View to display claim counts, total requested amounts, and average requested amounts for each claim type.
9. Create workflows for claim submission, investigation, approval, rejection, and settlement.
10. Configure appropriate access permissions and verify report refresh settings.
11. Enter sample claim records and test the forms, validation rules, reports, and workflows.
12. Verify that the records appear correctly in the reports and that claim processing follows the configured workflow.

Result

The Insurance Claim Request & Processing Management System was developed in Zoho Creator with a structured claim request form, validation rules, reports, and automated workflows. The workflows support claim submission, investigation, approval, rejection, and settlement. The application organizes claim information and supports claim tracking, analysis, and processing through different report types.
