8.Experiment: User Management & RBAC in Zoho Creator

Aim :

To configure user management and Role-Based Access Control (RBAC) in the Insurance Claim Request & Processing Management application to secure modules, restrict data visibility, and assign permissions according to organizational roles

Workflow:

Role-Based Access Control restricts application access according to each user's organizational role. In the insurance claim application, three main user roles can be configured.

Role-Based Access Control Table

Role Name	Assigned Permissions	Data Access Scope
Administrator	Full Create, Read, Update, Delete (CRUD) permissions	All records across the organization
Claims Manager	Read, Update, Approve records	Claims assigned to the relevant department
Claims Processing Staff	Create and Read records	Own submissions and authorized claims

Procedure

Step 1: Access Developer Mode

1. Log in to Zoho Creator.
2. Open the Insurance Claim Request & Processing Management application.
3. Navigate to the Settings section in the application builder.

Step 2: Configure Users and Roles

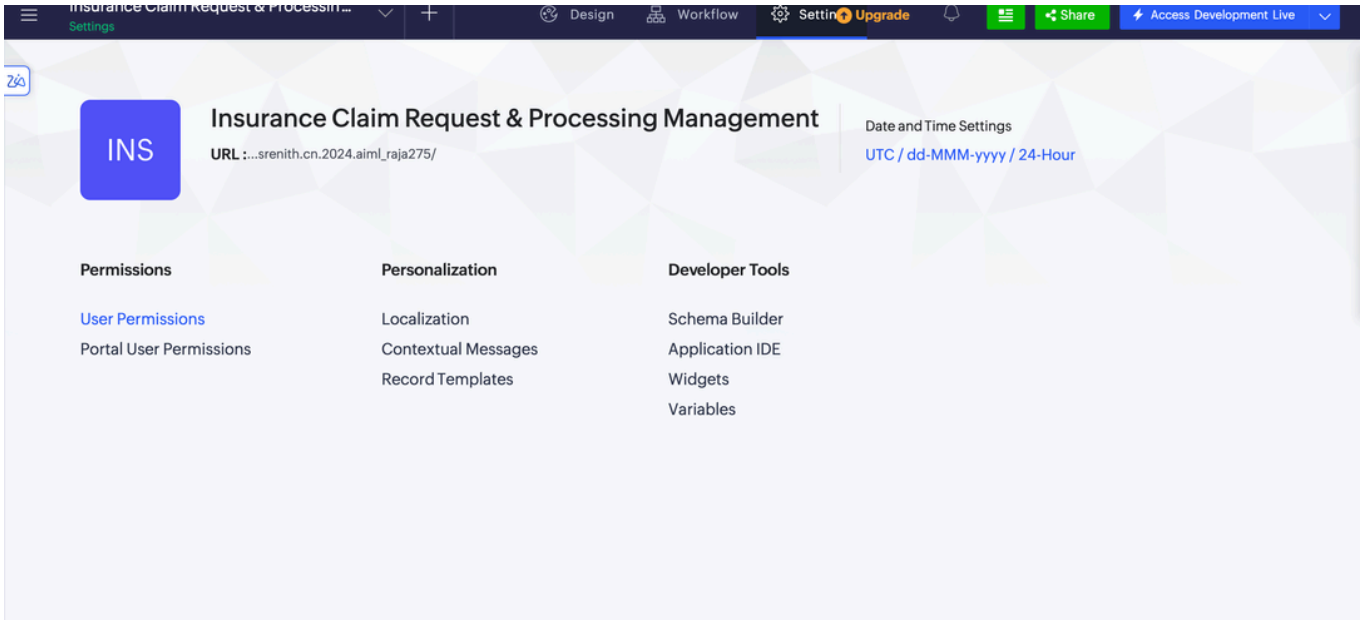

1. Select Users & Permissions under the Users section.
2. Open the Roles tab.
3. Create custom roles such as Claims Manager and Claims Processing Staff, alongside the Administrator role.
4. Assign users to the appropriate roles.
5. Configure reporting relationships where required.

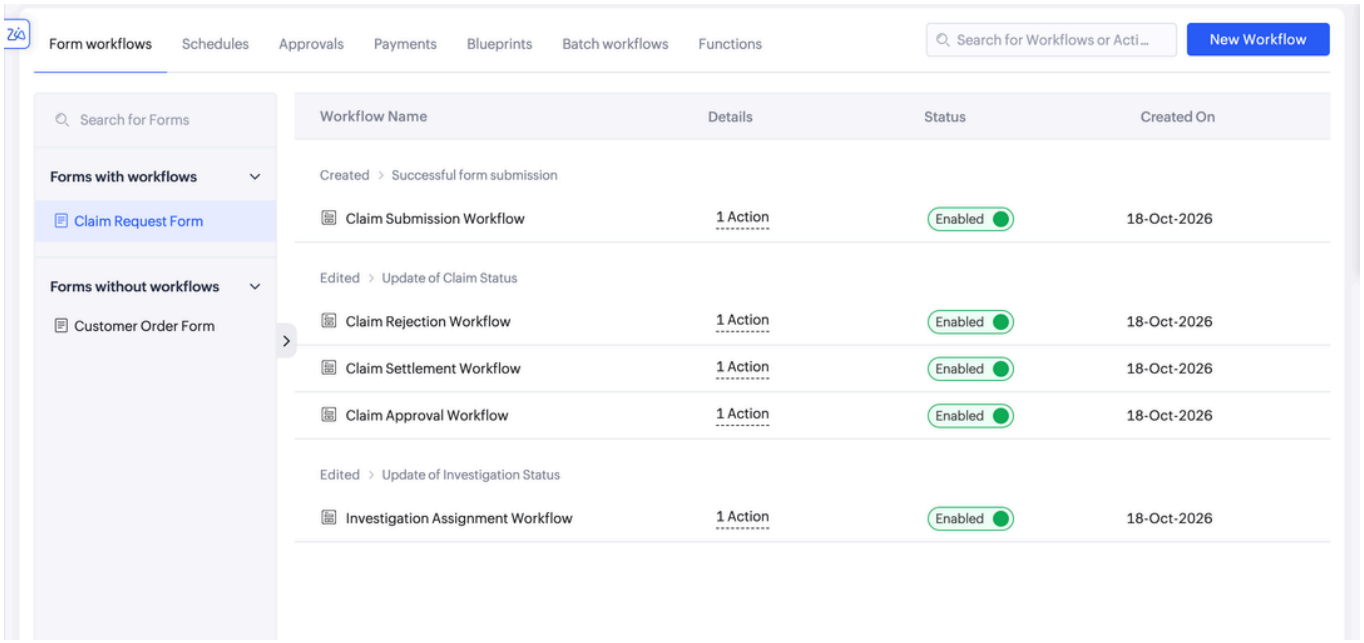

Step 3: Define Profiles and Permissions

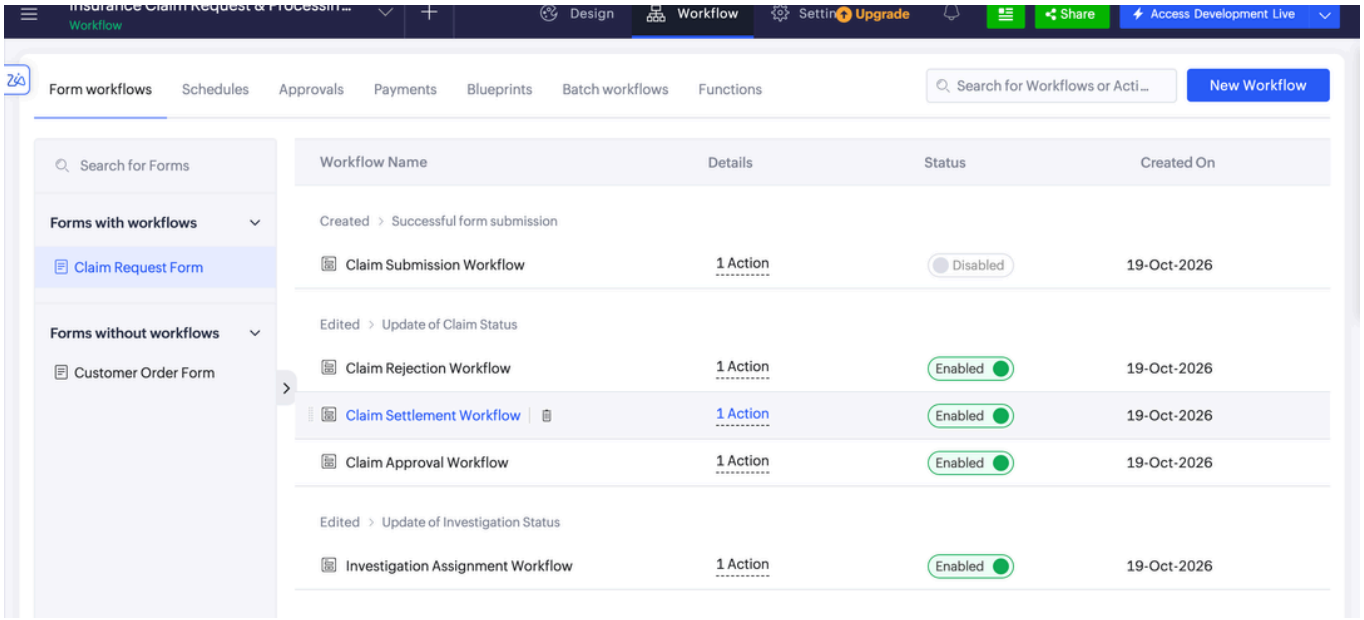

1. Open the Profiles section.
2. Configure permissions for creating forms, viewing reports, editing records, and deleting records.
3. Restrict access to sensitive information according to user responsibilities.
4. Configure surveyor access to assigned claims where supported.
5. Allow senior management to access appropriate analytical reports without unnecessary editing privileges.

Step 4: Test Access Control

1. Log in using test accounts with different roles.
2. Verify that administrators can access all authorized records.
3. Check that claims managers can review and update permitted claims.
4. Confirm that claims processing staff can access only the records and functions permitted by their assigned permissions.
5. Verify that unauthorized users cannot access restricted records or perform prohibited actions.

Result:

Role-Based Access Control was studied for the Insurance Claim Request & Processing Management application. The configured roles are intended to restrict access to claim records, protect sensitive information, and provide appropriate permissions for administrators, claims managers, and claims processing staff.
