6. Blood Donor & Camp Management – Automation Suite & Workflow Options

Aim

To design and document the automation layer for the Insurance Claim Request & Processing Management application using Zoho Creator workflow options, focusing on form validation, claim processing, approval, rejection, and settlement automation.

Objective

This experiment demonstrates how Zoho Creator workflows can automate insurance claim registration, investigation, approval, rejection, and settlement. It includes form validation and explores additional workflow options for automating routine claim-processing operations.

Workflow Mapping Overview

Workflow Type	Workflow Name	Configuration / Purpose
Form Validation	Validate_Insurance_Claim	Validates claim amounts and policy dates before accepting a claim.
Form Workflow	Initialize_Claim_Submission	Initializes claim status and submission date after a successful
Form Workflow	Assign_Claim_Surveyor	Supports surveyor assignment when investigation begins.
Schedule	Pending_Claim_Reminder	Proposed schedule to identify pending claims and send reminders.
Approval	Insurance_Claim_Approval	Proposed approval process for reviewing and approving claims.
Blueprint	Insurance_Claim_Lifecycle	Proposed process to control claim stages from submission to settlement
Function	Claim_Processing_Function	Proposed reusable Deluge function for claim-processing

Detailed Workflow Configurations & Evidence

1. Form Validation – Validate_Insurance_Claim

Purpose: Ensures that insurance claim records contain valid information before submission.

Validation rules:

- Claim Amount Requested must not be negative.
- Approved Amount must not be negative.
- Policy End Date must not be earlier than Policy Start Date.
- Date of Incident must fall within the policy period.

Action: Displays a validation message and prevents submission when the entered values violate these rules.

Testing: Enter invalid amounts or policy dates and verify that the form rejects the records.

2. Form Workflow – Initialize_Claim_Submission

Purpose: Initializes claim information after successful submission.

Proposed actions:

- Set Claim Status to Submitted.
- Record Claim Submitted On.
- Initialize investigation and settlement statuses appropriately.

Testing: Submit a test claim and verify that the initial status and submission date are populated correctly.

3. Form Workflow – Assign_Claim_Surveyor

Purpose: Supports surveyor assignment when a claim enters the investigation stage.

Proposed actions:

- Detect when Investigation Status changes to In Progress.
- Assign or record the responsible surveyor.
- Allow investigation notes and status updates.

Testing: Update a test claim to In Progress and verify that surveyor assignment works as configured.

4. Schedule – Pending_Claim_Reminder

Purpose: Provides a proposed automation for identifying claims that remain pending.

Proposed actions:

- Run at a configured interval.
- Identify claims awaiting investigation or approval.
- Notify the responsible claims-processing staff if notification functionality is configured.

Current status: Proposed; requires implementation and testing if not already configured.

5. Approval – Insurance_Claim_Approval

Purpose: Provides an approval process for reviewing claims before settlement.

Proposed stages:

- Claim submitted.
- Claim under investigation.
- Investigation completed.
- Claim approved or rejected.

Current status: Your existing approval workflow reportedly requires the investigation to be completed before approval. A separate approval process should only be added if necessary.

6. Blueprint – Insurance_Claim_Lifecycle

Purpose: Provides a structured process for controlling claim progression through defined stages.

Proposed transitions:

Submitted → Under Investigation → Approved → Settled

A claim may instead move to Rejected when the rejection conditions are satisfied.

Current status: Proposed; not yet implemented unless a Blueprint has already been created.

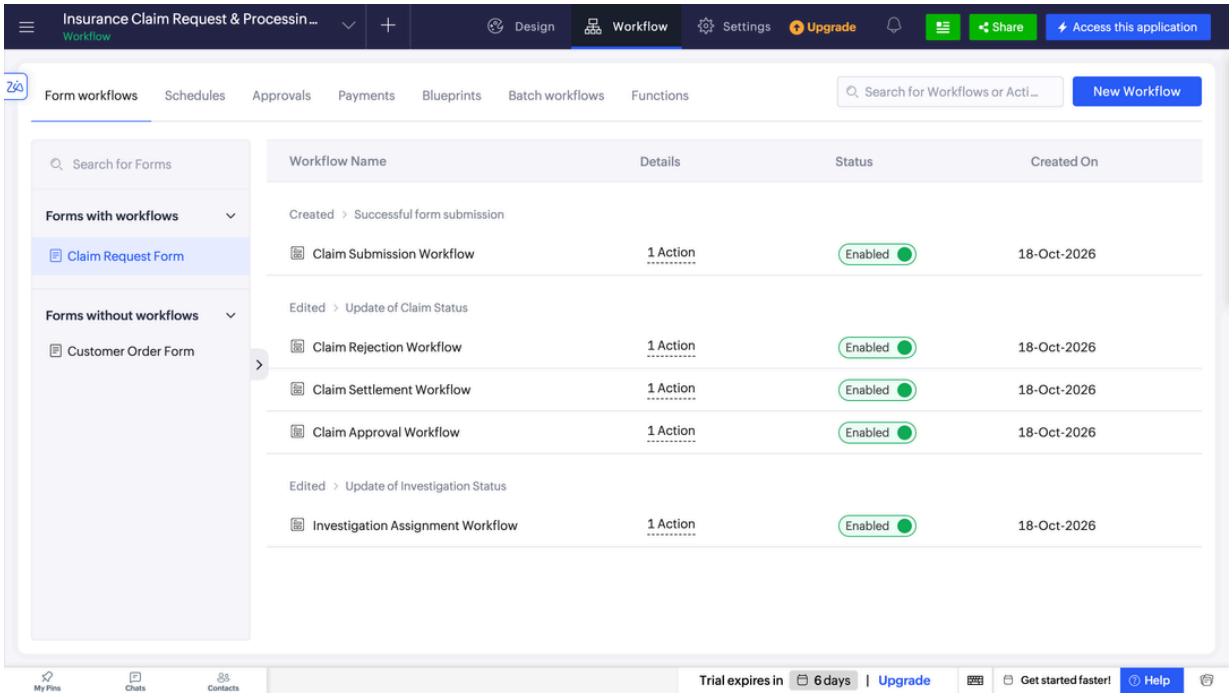

7. Function – Claim_Processing_Function

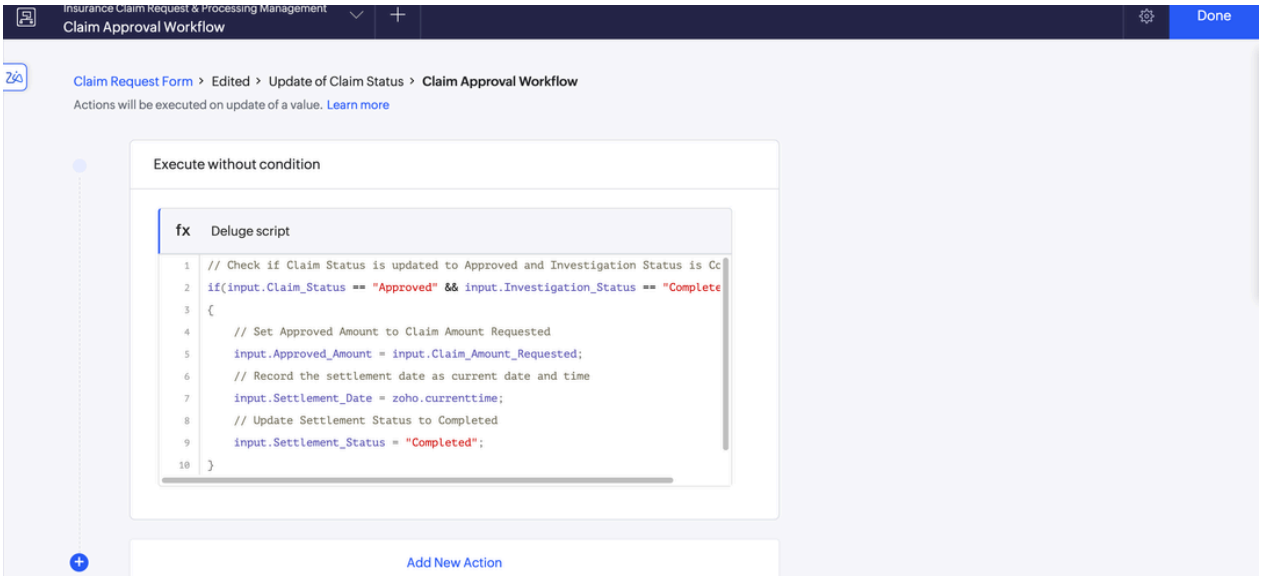

Purpose: Provides a reusable Deluge function for repeated claim-processing tasks.

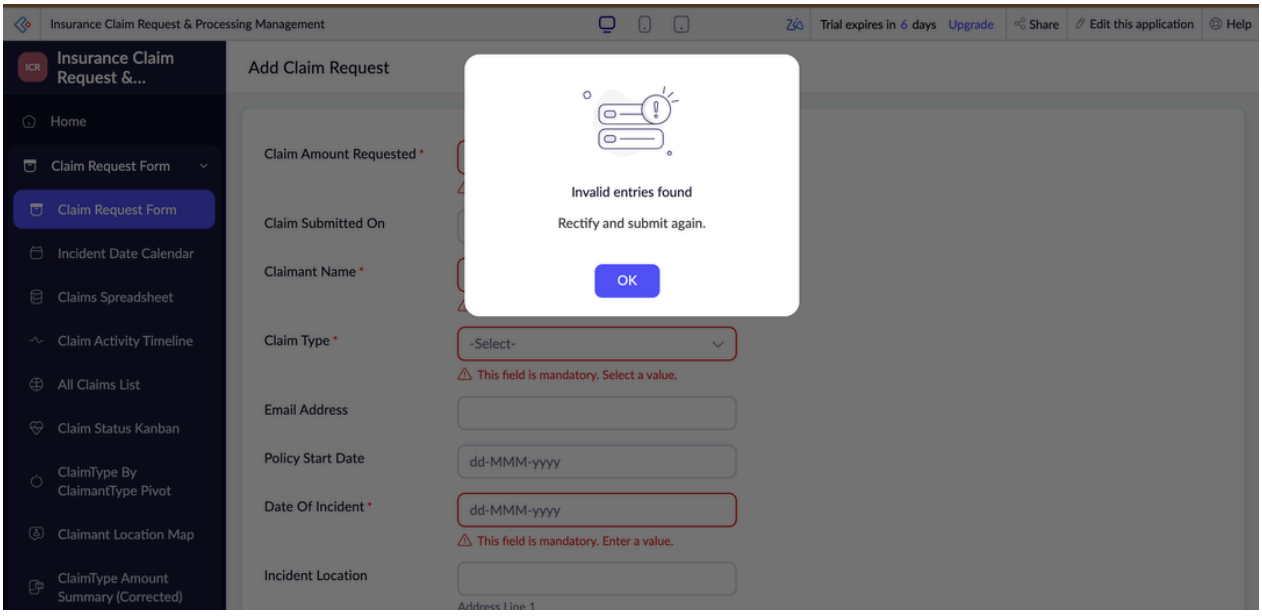

Proposed operations:

- Validate claim amounts and policy dates.
- Check claim status before processing.
- Support surveyor assignment.
- Verify approval conditions before settlement.

Current status: Proposed; requires implementation and testing if not already configured.

Result

The Insurance Claim Request & Processing Management application includes claim-validation and claim-processing workflows to support accurate claim submission, investigation, approval, rejection, and settlement. Additional automation options, including scheduled reminders, Blueprint lifecycle management, and reusable Deluge functions, can further improve processing efficiency.
