9. Experiment: AI-Assisted Features & Zia Analytics in Zoho Creator

Aim:

To explore and configure built-in artificial intelligence capabilities using Zia and advanced analytics features in the Insurance Claim Request & Processing Management application for intelligent data querying, predictive forecasting, and automated insights

Overview:

Zoho Creator integrates Zia, a conversational AI and analytics assistant, to support natural-language queries, automated chart creation, anomaly detection, and predictive analytics.

1. Zia Voice & Chat

Zia allows users to query application data and access reports through conversational commands.

Application: Users can ask questions about insurance claims, such as the total number of claims submitted or the number of claims grouped by Claim Type.

2. Smart Analytics

Smart Analytics suggests metrics, pivot tables, and visual charts based on application data.

Application: It can help analyze claim distributions by Claim Type, Claim Status, and Claimant Type using the available data and supported analytics features.

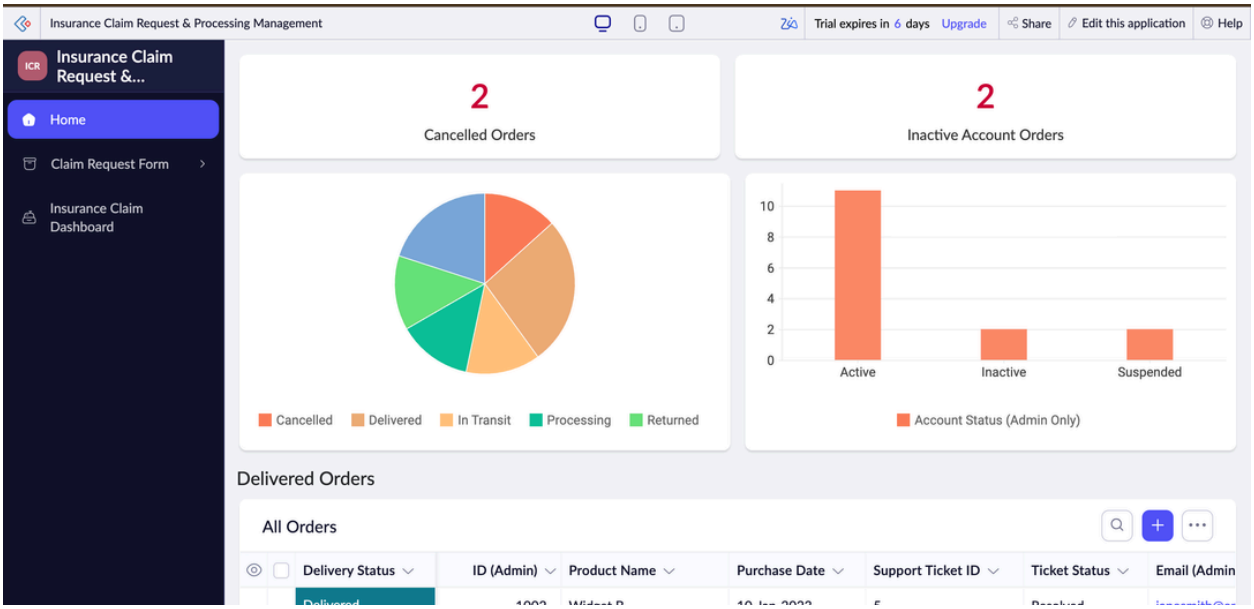

3. Anomaly Detection

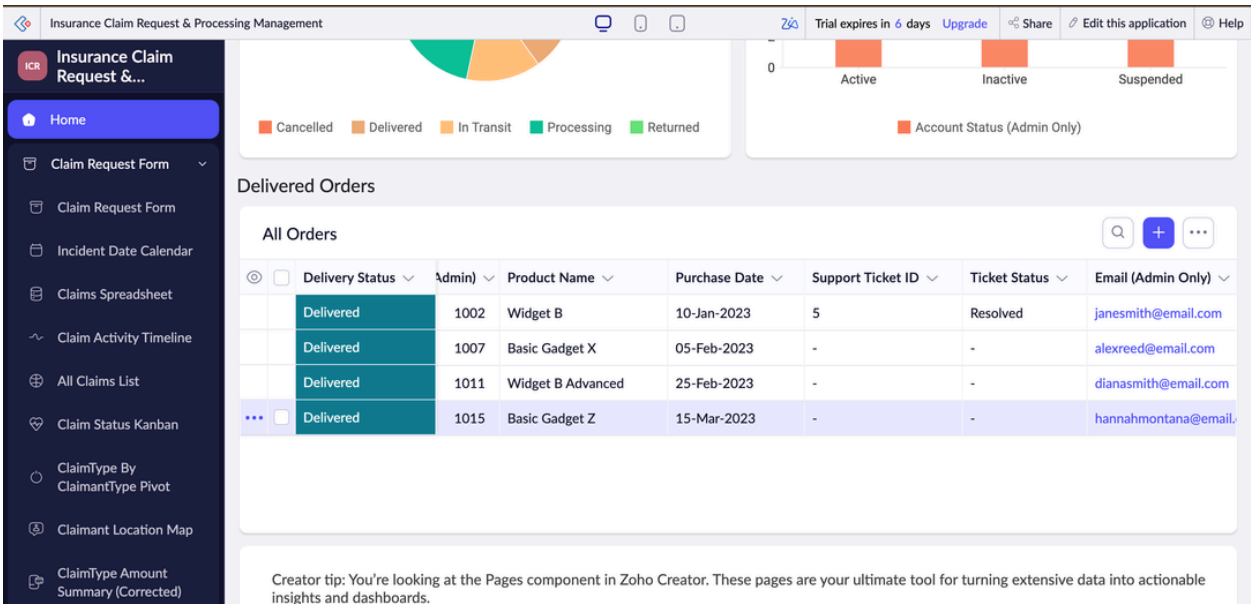

Anomaly detection identifies unusual data patterns, transaction spikes, or irregular entries using machine-learning techniques.

Application: It could help identify unusually high claim amounts, unexpected increases in claim submissions, or unusual claim patterns if the relevant feature is available and configured.

Procedure:

1. Open the Insurance Claim Request & Processing Management application in Zoho Creator.
2. Navigate to the Analytics module and check whether Zia integration is available and enabled for the application data.
3. Use the natural-language query interface to ask questions about claim records.
4. Generate analytics and charts using prompts such as:
5. “Show the total number of claims grouped by Claim Type as a pie chart.”
6. “Show the number of claims grouped by Claim Status.”
7. “Calculate the total Claim Amount Requested for each Claim Type.”
8. Explore automated dashboard recommendations and suggested metrics, where available.
9. Configure prediction models using historical claim records if predictive analytics is supported.
10. Review available insights for unusual claim amounts or changes in claim submission patterns.
11. Verify that the generated charts and analytics correctly reflect the application’s data.

Result:

The experiment explores AI-assisted analytics for the Insurance Claim Request & Processing Management application using Zia and available analytics features. These capabilities can support natural-language data exploration, chart generation, trend analysis, and identification of unusual claim patterns without requiring extensive manual scripting.
