7. Integrating Zoho Creator with Zoho CRM via Connections and APIs

Aim

To integrate the Insurance Claim Request & Processing Management application in Zoho Creator with Zoho CRM using authenticated connections and workflow actions, enabling synchronization of insurance claimant details and claim information between the two platforms.

Theory

Zoho Creator can integrate with Zoho CRM using authenticated connections, APIs, and workflow actions. This allows information entered in Creator forms to be transferred to CRM modules for centralized customer and claim management.

In this experiment, the Claim Request Form is used as the primary source of insurance claim information. It contains claimant details, policy number, claim type, requested amount, incident information, and claim status.

When a claim is submitted, a workflow can send selected information to an appropriate Zoho CRM module. Field mapping ensures that claimant names, email addresses, phone numbers, policy numbers, and claim details are transferred to corresponding CRM fields.

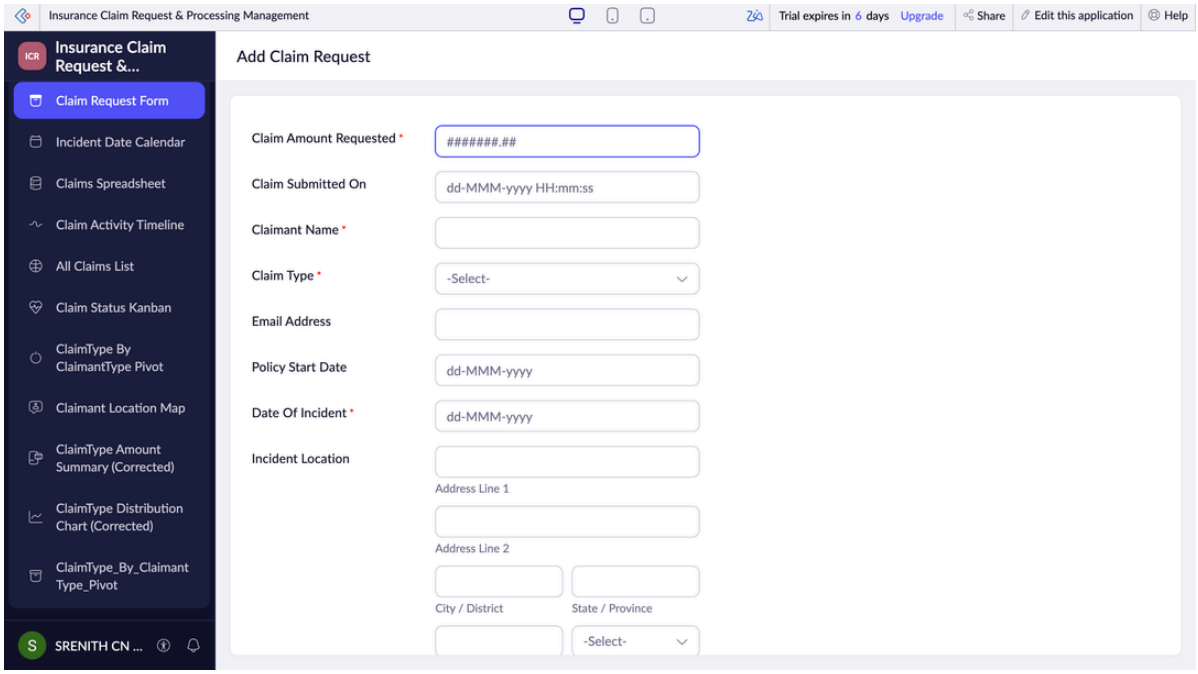

An authenticated connection is required to authorize communication between the applications. The integration must be tested with fictional data to confirm that records are transferred correctly.

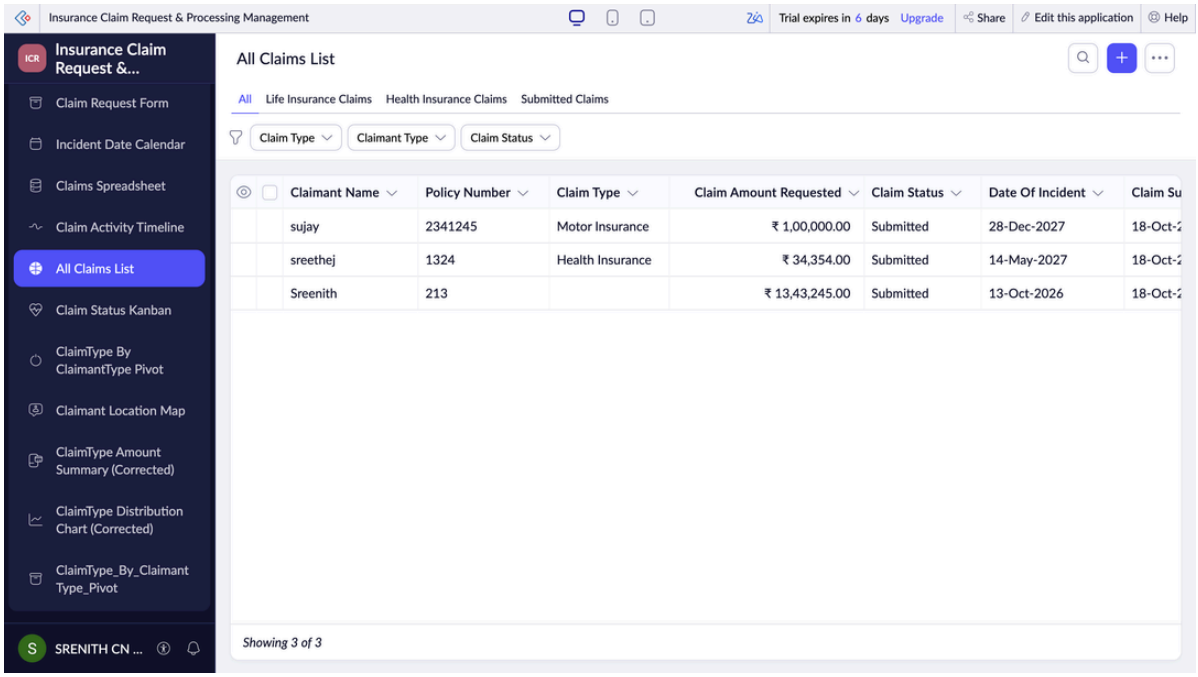

Procedure

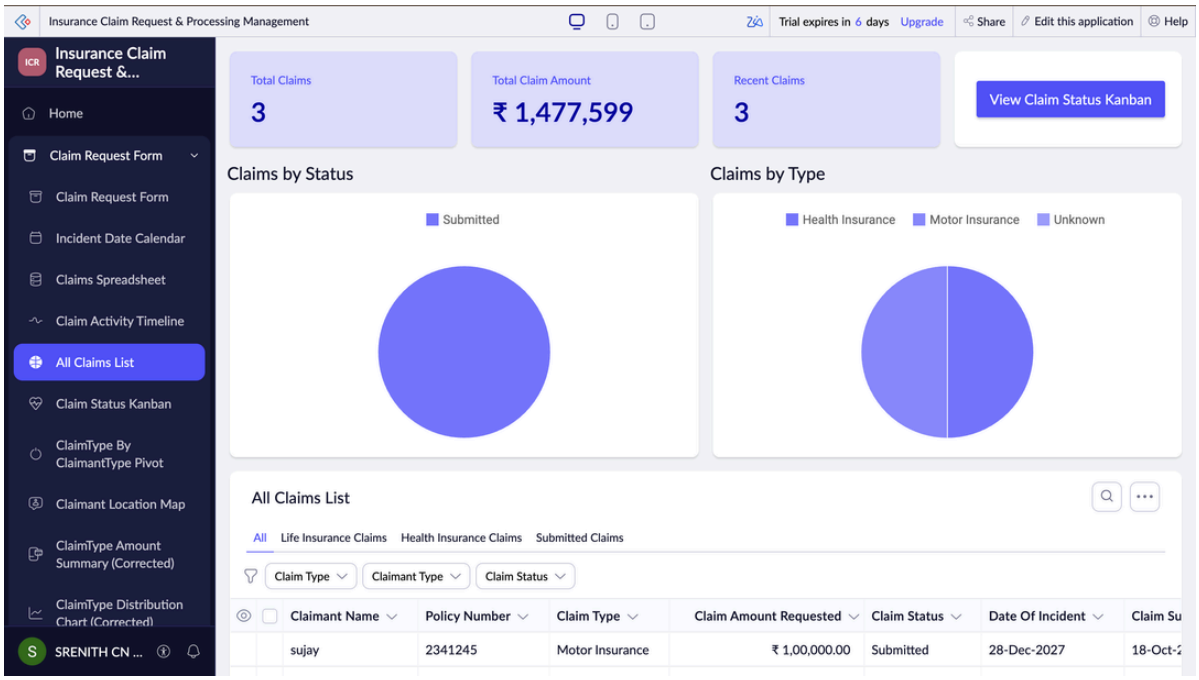

1. Open the existing Insurance Claim Request & Processing Management application in Zoho Creator.
2. Open the Claim Request Form, which stores claimant information, policy details, incident information, requested claim amounts, and claim statuses.
3. Open the Connections or integration settings in Zoho Creator.
4. Select Zoho CRM and configure an authenticated OAuth connection with the required permissions.
5. Verify that the connection is established successfully.
6. Navigate to the workflow section and create a workflow for the Claim Request Form.
7. Configure the workflow to trigger after a successful claim submission.
8. Add an appropriate Zoho CRM integration action or API call to create a record in a suitable CRM module.

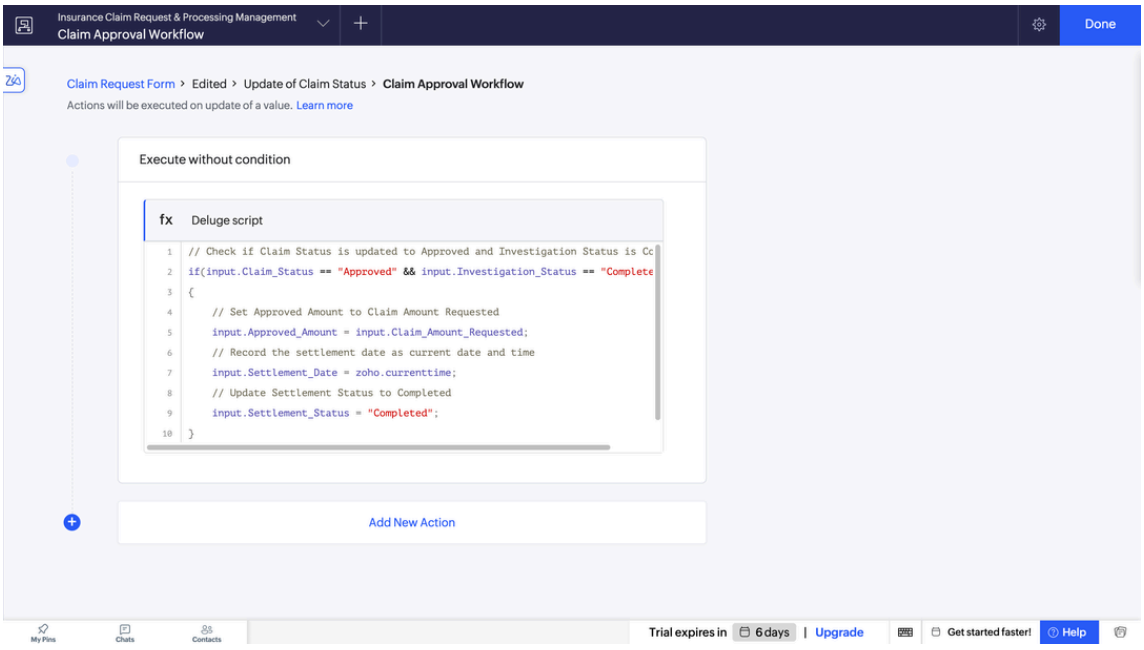

9. Map the required fields, such as Claimant Name, Email Address, Contact Number, Policy Number, Claim Type, and Claim Amount Requested, to their corresponding CRM fields.
10. Save the workflow and verify that its configuration is valid.
11. Submit a test claim using fictional demonstration data.

Check the selected Zoho CRM module to verify that the mapped record appearscorrectly.

Result

The Blood Donor & Camp Management application provides the forms and data structure required for integration with Zoho CRM. The integration can be completed by establishing an authenticated connection, configuring a donor submission workflow, mapping the required fields, and verifying successful record synchronization. The integration result should be reported as successful only after the connection and workflow have been implemented and tested.
